Data on renewable power capacity represents the maximum net generating capacity of power plants and other installations that use renewable energy sources to produce electricity.

Ember's recent Global Electricity Review revealed that wind and solar produced 2,435 TWh of electricity in 2020, providing almost a tenth of the world's electricity.

World Wind Market has reached 486 GW from where 54 GW has been installed last year The worldwide wind capacity reached 486"661 MW by the end of 2016, out of which 54"846...

Annual net wind capacity additions are expected to reach 65 GW in 2020, 8% more than in 2019.

On average, EIA estimates that wind accounted for 9% of U.S. electricity generation in 2020. Wind-powered electricity has increased in the ...

Overall, wind energy has become the largest renewable electricity source in the U.S., accounting for roughly 10 percent of electricity generation in the country.

This dataset contains yearly electricity generation, capacity, emissions, imports and demand data for European countries. You can find more ...

Wind power generation supplied a bulk of new US power capacity in 2020 as the Biden administration pushes for more offshore wind power. Wind ...

OverviewHistoryEconomicsNational trendsWind power by stateCommercialization of wind powerOffshore wind powerWind energy meteorologyWind power is a branch of the energy industry that has expanded quickly in the United States over the last several years. In 2024, 451.9 terawatt-hours were generated by wind power, or 10.49% of electricity in the United States. The average wind turbine generates enough electricity in 46 minutes to power the average American home for one month. In 2019, wind power surpassed hydroelectric

2020 wind power generation share

power as the largest renewable energy source in the U.S

The share of wind in overall U.S. energy production rose 5.5 percentage points from 2011 through 2020 as generation from the leading U.S. renewable fuel nearly tripled in the interval.
